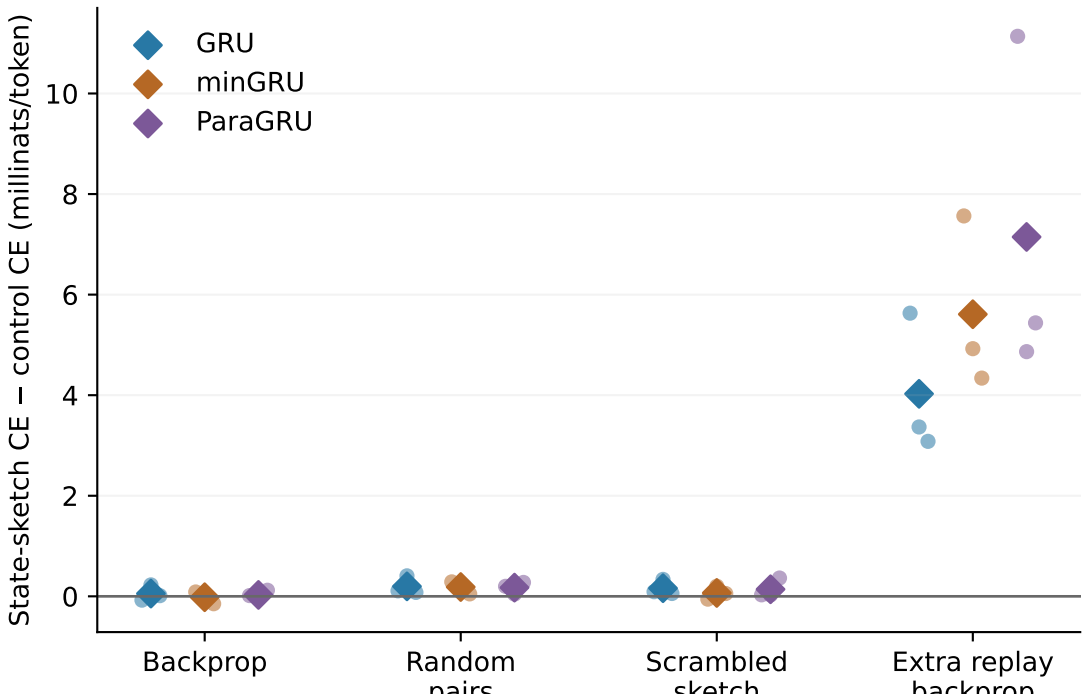
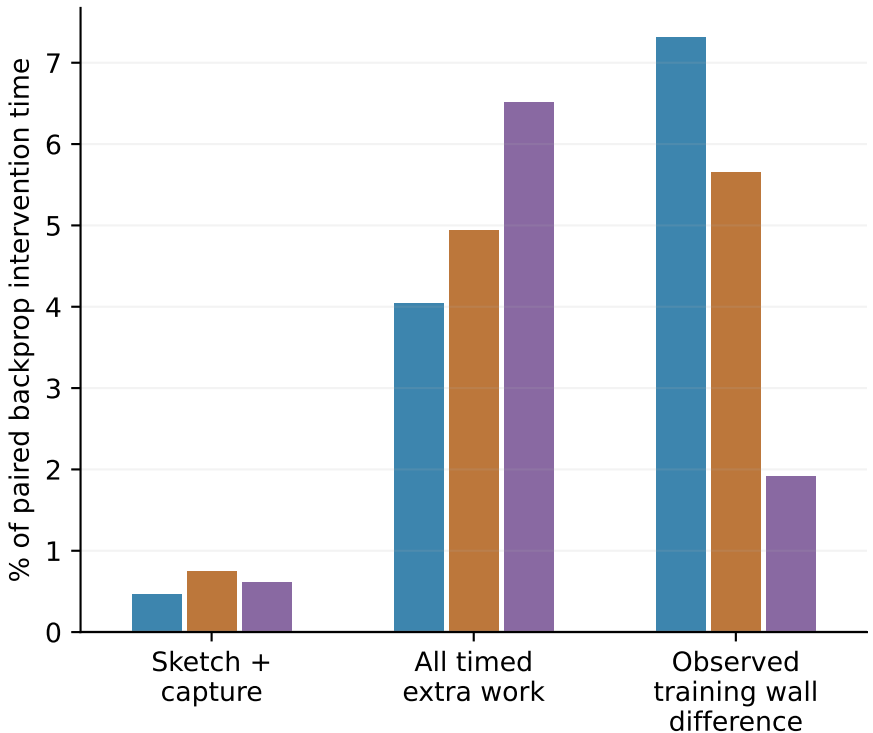
Super-1: cheap structural anchors did not establish a useful perturbation gain

Held-out effect after 32 follow-up updates
Below zero favors the state sketch



CPU cost, averaged over three seeds
Observed wall difference includes timing noise



3 seeds per architecture • 173–178k parameters • WikiText-2 training documents split into train/held-out
Dots: individual seeds; diamonds: means. Predeclared useful effect: −5 millinats vs both structural controls.
